

Lilly Greene

How would you feel if one day your house was destroyed? What if your water was contaminated, poisoned and your air too polluted to breathe? This is the way some animals may feel if foresters don't take care of the places they cut trees. Luckily, most foresters take care of nature. Here are some ways that if I were a forester, I would take care of forests, trees, and habitats.

I would make sure animals and people are clear of the area before cutting trees. I want everyone to be safe. I would be sure to pick up plastic or other litter I find or leave in the woods. I wouldn't want any animals to eat it or get tangled in it.

I would try to use machines that use bio energy so that it makes less pollution and is a renewable source. Bio energy is fuel made out of trees and plants. Also, if I cut trees

ground water, I will use broad-based dips, water bars, and culverts to prevent erosion.

Foresters have to be careful when cutting trees near water. I can't let lots of soil become loose when trees are cut or it could run down into the creek or river and clog it up. One way I can prevent that is replant new trees after cutting down old ones. I just have to make sure I have permission. That way we will always have forests and fresh air. I also want to ensure that trees that are harvested go to a location that uses all aspects of the tree. I don't want anything getting wasted.

These are lots of ways that I would take care of the environment for years to come.
